

Nutrition & Mortality SMART Survey Preliminary Report

Badghis Province, Afghanistan

3rd to 20th February, 2016

Reported by: Dr. Baidar Bakht Habib

Funded by:  OCHA

ACKNOWLEDGMENT

Action Contre la Faim (ACF) Afghanistan would like to thank the following stakeholders for their support in successful implementation of nutrition and mortality SMART survey in Badghis province.

- All the community members for welcoming and supporting the survey teams during the data collection process.
- Badghis PPHD especially Dr. Abdul Rauf Sabiri, current Badghis Provincial Nutrition officer (PNO) for the support provided in authorization of the survey.
- Common Humanitarian Fund (UNOCHA-CHF) for their financial support in the survey.
- ACF teams in Kabul, Mazar and Paris for logistics, technical and administrative support.
- MOVE Welfare Organization for Afghanistan team in Badghis and Kabul, especially Dr. Ezatullah Akbari, Dr. Attiqullah (Akbari) Dr. Fazal Abkabr , Dr. Hamidullah (Fasial), Dr. Merwais (Shinwari) , Dr. Abdullah Hedayat and Abdullah Tawakali for providing support during planning, data collection and development of action plans.
- Survey teams composed of enumerators, team leaders and supervisors for making the whole process smooth.

EXECUTIVE SUMMARY

The nutrition and mortality SMART¹ survey was conducted from 3rd to 20th of February 2016, in the six districts of Badghis Province. A total of 524 randomly selected households were assessed. The nutrition and mortality SMART survey preliminary report provides a summary of the methodology used, analysis and interpretation of survey findings and recommendations proposed. The final report will comprehensively provide an analysis and interpretation of nutritional findings and potential risk factors contributing to under-nutrition. The final report will be disseminated to the wider stakeholders after validation process scheduled to complete in month of May, 2016.

Summary findings

- A total of 944 children aged (0-59) months and 873 children aged (6-59) months children were assessed
- Global Acute Malnutrition (GAM) and Severe Acute Malnutrition (SAM) prevalence based on Weight -for- Height Z-scores (WHZ) was at 6.5% (4.8- 8.8 95% CI) and 0.4% (0.1- 1.1 95% CI) respectively. Prevalence of oedema was at 0.0%
- GAM and SAM prevalence based on Mid Upper Arm Circumference (MUAC) was at 8.6% (6.5- 11.3 95% CI) and 1.6% (0.9- 3.0 95% CI) respectively.
- The combined MUAC and WHZ based on both criteria revealed GAM and SAM rates 13.1% (10.8-15.3 95% C.I.) and 3.2%(2.0-4.4 95% C.I.) respectively
- Crude Death Rate (CDR) and Under-five Death Rate (U5DR) was at 0.13 (0.06-0.30 95% CI) and 0.60 (0.28-1.27 95% CI) respectively.
- Prevalence of stunting was at 52.5% (47.1-57.8 95% CI) while severe stunting was at 25.0% (20.8-29.7 95% CI).
- Prevalence of underweight was 23.0% (19.5-27.0 95% CI) and severe underweight was 6.7% (5.1- 8.7 95% CI).
- The nutritional status of pregnant and lactating mothers based on MUAC cut off <230mm was at 21.2%.

¹ Standardized Monitoring of Assessment for Relief and Transition

INTRODUCTION

Badghis is one of the 34 provinces of Afghanistan, located in the northwest of the country next to Turkmenistan. Its northern border extends to the edge of the desert of Sarakhs. Badghis includes the Chul formations through which the Turkmen-Afghan boundary runs. The province was carved out of portions of Herat and Faryab Province in 1964 and has a total area of 20,591 km². Two rivers cross the province, namely Murghab River in the north and the Hari-Rud River in the south. Badghis is listed as one of the most underdeveloped province in the country. Qala-i-Naw, a small town halfway between Maimana and Herat, serve as the provincial center.

According to Central Statistic Organization (CSO) Badghis has seven districts namely Ab Kamari, Jawand, Muqur, Qadis, Ghormach, Murghab and the city of Qalai Naw. However, the system of Basic Package of Health Services (BPHS) considers that Badghis has six districts. BPHS in Ghormach district is under Farah province. The total population of Badghis is 394,689² consisting of mainly Tajik (62%), Pashtun (28%), Uzbek (5%), Turkmen (3%), and Baloch (2%). The surveyed population was 283,935 representing 71.9 % of the entire population. The remaining population was not included in to the sampling frame due to limitation attributed to insecurity at the time of the assessment.

The survey was conducted from 3rd - 20th February 2016. ACF technically supported MOVE welfare Organization³ to implement this survey with the justification of investigating and finding the current prevalence of nutrition, mortality and IYCF. It is expected that the survey findings will be used to inform programing and it was considered as a good opportunity to build capacity of MOVE Welfare Organization staffs. The information generated from the assessment will provide an updated nutrition, mortality and children health and immunization situation of most venerable population of Badghis province. This information is also expected to complement the National Nutrition Survey in 2013.

SURVEY OBJECTIVES

The overall survey objective was to evaluate the nutritional status of vulnerable groups mainly children less than five years of age in the Badghis province and factors contributing to it.

² Estimated Settled Population by Civil Division, Urban, Rural and Sex-2013

³ The current BPHS implementing partner in Badghis province.

METHODOLOGY

Sample Size

The sample size of households to be surveyed was determined using ENA for SMART software version 2011 (up dated 9th July 2015). A two stage cluster methodology was applied. In first stage random selection of clusters/villages (48 clusters) from total list of villages using probability proportion of size (PPS) was applied. This was done before starting the data collection. The **table 1 and 2 highlights** sample size calculation for anthropometric, mortality surveys.

Table 1: Parameters for sample size calculation of anthropometric indicators, Badghis SMART, February 2016

Parameters for Anthropometry	Value	Assumptions based on context
Estimated prevalence of GAM (%)	5.6 %	As GAM results for Badghis Province from NNS 2013 was displaying Standard Deviation (SD) of 1.8, above the recommended limit of 1.2, it was preferred to retain the GAM prevalence for Herat (5.6 % (95 % CI: 3.99-7.77)) as the SD was within the limit of 1.2
± Desired precision	2.5%	For an estimate point prevalence of 5.6% a precision of ±2.5 is recommended by SMART methodology
Design Effect	1.5	The standard design effect of 1.5 was used
Children to be included	531	Minimum Children 6-59 months old. However all children from 0 to 59 months old found in the selected households were surveyed
Average HH Size	7.7	According to the National Nutrition Survey 2013, the average household size was 7.7
% Children under-5	15.6%	The estimated U5 population according to the Afghanistan Mortality survey 2010 is at 15.6% providing a more conservative and accurate percentage ⁴
% Non-response Households	6%	Based on previous experiences, the percentage of non-respondent households was estimated at 6%.
Households to be included	522	Minimum households to be surveyed to get the minimum anthropometric sample

⁴ Afghanistan Mortality survey, 2010

Table 2: Sample size calculation for mortality survey, Badghis SMART, February 2016

Parameters for Mortality	Value	Assumptions based on context
Estimated Death Rate /10,000/day	0,5	Recommended in cases where there is no specific mortality data from the area
± Desired precision	0.3	In order to meet set mortality objectives and inline to estimated death rate
Design Effect	1.5	Caters for heterogeneity in the population being sampled
Recall Period in days	142	Starting point of recall period (during the start of 1st Mezan1394 (from Eid Qorban) is equal to (23 rd September 2015 Georgian calendar.)
Population to be included	2,904	Minumum individuals
Average HH Size	7.7	National vulnerability assessment of Afghanistan -2014 and National Nutrition Survey 2013
% Non-response Households	6%	The percentage of non-respondent households was estimated at 6%. Using the same percentage as that of 2011 and similar to the non-response rate of the national nutrition survey for Afghanistan (2013) ⁵ of 6%.
Households to be included	401	Minimum households

Based on the parameters indicated above, Anthropometric sample will be used as the overall sample size since it is the highest and therefore qualifies to represent the other indicators. Therefore with the selection of the highest sample size (522 HH) the other indicators will have representation within the larger sample size selected.

Final Sample Strategy

A two-stage cluster sampling methodology was employed. In the first stage, clusters/villages were randomly selected from a total list of villages (401) representing all the districts (Murghab, Ab Kamari, Jawand, Muqar, Qadis and Qali Naw) of the province (with exception of insecure villages) using Probability Proportional to Size (PPS⁶) design. Selection of villages to be covered as well as Reserve Clusters (RC⁷) was automatically provided using ENA for SMART. A total of 48 clusters were proposed and successfully covered. It have been estimated that a single team can cover a maximum of 11 households in a day. The extrapolation of required number of villages was derived from dividing the minimum sample size of 522 households by 11 to get an approximate 48 clusters (522HHs/11HHs). During survey data collection when large population, the village was sub-divided into smaller segments using natural borders (neighborhoods, rivers, roads, streets and mosque) and a segment was selected randomly to represent the village.

⁵ National Nutrition Survey of Afghanistan, UNICEF, 2013

⁶ . Villages with large population have higher chance of being selected than those with small populations

⁷ To be used only if 10% of the selected clusters are not accessible

The second stage involved random selection of households from a total list of households for each of the sampled villages. All households in each of sampled villages were enumerated and given numbers by the survey team. A total of 11 households were chosen randomly by survey team drawing folded papers with numbers of households from a hat.

The household was the basic sampling unit. Here, a household was defined as all people eating from the same pot and living together (WFP definition). In Afghanistan, the term household is often defined and/or used synonymous with a compound - which potentially represents more than one household as defined here. In this case, a two-step process was ensured with the village leaders/community elders and then identifying compound together with the use of the list of households within the community, asking if there are multiple cooking areas to determine what members of the household/compound should be included in the study.

A total of 524 households were reached with 944 children under-5 living in respective randomly sampled households. Out of them, 873 were children 6-59 months. 608 women of childbearing age were surveyed too.

Table 3 summarizes the sample size proposed and the actual achieved. During data collection, survey team had to revisit households at the end of the day to ensure children missing or households not present at the initial visit were covered. A cluster control form was used to record all the missed and absent households.

Table 3: Details of proposed and actual sample size achieved, Badghis SMART, February 2016

Number of HH planned	Number of HH surveyed	% surveyed /planned	Number of children 6-59 months planned	Number of children 6-59 months surveyed	% surveyed /planned
528	524	99.2%	531	873	164.4%

Survey team composition

The survey data collection team of six teams with each team having four members. Each team was composed of one MOVE Welfare Organization supervisor, one team leader and two data collector. Each team had at least one female data collectors to ensure acceptance of the team amongst the surveyed households. During data collection every female member of the survey team was accompanied with a mahram⁸ to facilitate the work of the female data collectors at the community level. The teams were supervised by ACF and MOVE Welfare Organization nutrition program manager/nutrition focal points. The survey teams were trained on SMART methodology. The 5 days theoretical training was completed with

⁸ Women are not allowed to go outside without being accompanied by one male relative called locally a ‘mahram’.

standardization tests and pilot test exercise. The standardization test was also used to group various teams especially the data collectors.

Data entry and analysis

ENA for SMART software was also used to generate anthropometric and mortality results automatically. For the rest of the indicators, they were entered and analysed in Excel.

The anthropometric results are presented as percentage z-scores from WHO 2006 Growth references for the weight-for-height (wasting), height-for-age (stunting) and weight-for-age (underweight) indexes. Separate analysis of wasting based on MUAC cut-offs is automatically done by ENA for SMART too.

Plausibility check automatically generated is used to evaluate quality and representativeness of the data, and therefore - the reliability of the results.

RESULTS

Anthropometric results

The results are presented with exclusion of z- score from observed mean SMART flags: WHZ -3 to + 3, HAZ -3 to +3 and WAZ -3 to +3. Percentage of values flagged with SMART flags were classified as “excellent” (WHZ: 2,1 %, HAZ: 2,4 %, WAZ: 1,0 %). Age ratio was of 0,99 and sex ratio was 1,1 (refer to plausibility check in Annex 1).

Table 4: Distribution of age and sex of sample, Badghis SMART, February 2016

AGE (mo)	Boys		Girls		Total		Ratio
	no.	%	no.	%	no.	%	Boy:girl
6-17	136	58.1	98	41.9	234	26.8	1.4
18-29	108	53.7	93	46.3	201	23.0	1.2
30-41	119	51.3	113	48.7	232	26.6	1.1
42-53	65	44.8	80	55.2	145	16.6	0.8
54-59	28	45.9	33	54.1	61	7.0	0.8
Total	456	52.2	417	47.8	873	100.0	1.1

Undernutrition rates

The following tables present the under-nutrition rates as follows:

- ✓ Sex disaggregated weight-for-height z-scores (and/or oedema) and by sex (Table 5)
- ✓ Rates of oedema (Table 6)
- ✓ Sex disaggregated rates of MUAC cut-offs (Table 7)
- ✓ Sex disaggregated weight-for-age z-scores (Table 8)
- ✓ Sex disaggregated height-for-age z-scores (Table 9)

Table 5: prevalence of acute malnutrition based on weight-for-height z-scores (and/or oedema) and by sex, Badghis SMART, February 2016

	All n = 855	Boys n = 444	Girls n = 411
Prevalence of global malnutrition (<-2 z-score and/or oedema)	(56) 6.5 % (4.8 - 8.8 95% C.I.)	(29) 6.5 % (4.4 - 9.6 95% C.I.)	(27) 6.6 % (4.5 - 9.5 95% C.I.)
Prevalence of moderate malnutrition (<-2 z-score and >=-3 z-score, no oedema)	(53) 6.2 % (4.6 - 8.4 95% C.I.)	(27) 6.1 % (3.9 - 9.3 95% C.I.)	(26) 6.3 % (4.4 - 9.0 95% C.I.)
Prevalence of severe malnutrition (<-3 z-score and/or oedema)	(3) 0.4 % (0.1 - 1.1 95% C.I.)	(2) 0.5 % (0.1 - 1.8 95% C.I.)	(1) 0.2 % (0.0 - 1.8 95% C.I.)

Table 6: Distribution of acute malnutrition and oedema based weight-for-height z-scores, Badghis SMART, February 2016

	<-3 z-score	>=-3 z-score
Oedema present	Marasmic kwashiorkor No. 0 (0.0 %)	Kwashiorkor No. 0 (0.0 %)
Oedema absent	Marasmic No. 18 (2.1 %)	Not severely malnourished No. 855 (97.9 %)

The prevalence of oedema is 0.0 %

Table 7: Prevalence of acute malnutrition based on MUAC cut offs (and/or oedema), Badghis SMART, February 2016

	All n = 860	Boys n = 449	Girls n = 411
Prevalence of global malnutrition (< 125 mm and/or oedema)	(74) 8.6 % (6.5 - 11.3 95% C.I.)	(31) 6.9 % (4.7 - 10.1 95% C.I.)	(43) 10.5 % (7.6 - 14.2 95% C.I.)
Prevalence of moderate malnutrition (< 125 mm and >= 115 mm, no oedema)	(60) 7.0 % (5.2 - 9.3 95% C.I.)	(26) 5.8 % (3.7 - 9.0 95% C.I.)	(34) 8.3 % (5.7 - 11.8 95% C.I.)
Prevalence of severe malnutrition (< 115 mm and/or oedema)	(14) 1.6 % (0.9 - 3.0 95% C.I.)	(5) 1.1 % (0.4 - 3.1 95% C.I.)	(9) 2.2 % (1.1 - 4.4 95% C.I.)

Table 8: Prevalence of underweight based on weight-for-age z-scores and by sex, Badghis SMART, February 2016

	All n = 864	Boys n = 452	Girls n = 412
Prevalence of underweight (<-2 z-score)	(199) 23.0 % (19.5 - 27.0 95% C.I.)	(107) 23.7 % (19.5 - 28.4 95% C.I.)	(92) 22.3 % (17.7 - 27.7 95% C.I.)
Prevalence of moderate underweight (<-2 z-score and >=-3 z-score)	(141) 16.3 % (13.4 - 19.7 95% C.I.)	(77) 17.0 % (13.8 - 20.8 95% C.I.)	(64) 15.5 % (11.7 - 20.3 95% C.I.)
Prevalence of severe underweight (<-3 z-score)	(58) 6.7 % (5.1 - 8.7 95% C.I.)	(30) 6.6 % (4.3 - 10.1 95% C.I.)	(28) 6.8 % (4.7 - 9.6 95% C.I.)

Table 9: Prevalence of stunting based on height-for-age z-scores and by sex, Badghis SMART, February 2016

	All n = 852	Boys n = 449	Girls n = 403
Prevalence of stunting (<-2 z-score)	(447) 52.5 % (47.1 - 57.8 95% C.I.)	(248) 55.2 % (49.0 - 61.3 95% C.I.)	(199) 49.4 % (42.6 - 56.2 95% C.I.)
Prevalence of moderate stunting (<-2 z-score and >=-3 z-score)	(234) 27.5 % (24.5 - 30.7 95% C.I.)	(114) 25.4 % (22.5 - 28.5 95% C.I.)	(120) 29.8 % (24.5 - 35.7 95% C.I.)
Prevalence of severe stunting (<-3 z-score)	(213) 25.0 % (20.8 - 29.7 95% C.I.)	(134) 29.8 % (24.2 - 36.1 95% C.I.)	(79) 19.6 % (15.1 - 25.1 95% C.I.)

Quality of the anthropometric data

The digit preference score of the survey teams was classified as “excellent” for all. The sex ratio was within accepted limits, while the age ration was above the limit of 0,85. This suggest slightly biased sample, including more children from the younger age groups. Standards Deviations⁹ are within accepted limits.

The summary of the Mean Z-scores with their Standard Deviations, the design effects and number of the out of range data per index is the table 10 below.

Table 10: Mean z-scores, design effect and excluded subjects, Badghis SMART, February 2016

Indicator	n	Mean z-scores ± SD	Design Effect (z-score < -2)	z-scores not available*	z-scores out of range
Weight-for-Height	855	-0.16±1.10	1.34	0	18
Weight-for-Age	864	-1.27±1.03	1.69	0	9
Height-for-Age	852	-2.06±1.21	2.43	0	21

⁹ <http://www.who.int/nutgrowthdb/about/introduction/en/index5.html>

Nutritional status of women in childbearing age

608 women in childbearing age (15-49 years) living in the selected households have been surveyed. All of them accepted to have their mid-upper arm circumference measured. The results expressed in proportion from the total number of measured using MUAC cut-off of 230 mm, as per Afghani protocol, are presented in the table 11 below.

Table 11: Maternal nutritional status based on MUAC cut-off<230mm, n=608, Badghis SMART, February 2016

MUAC cut off	Frequency(n)	Proportion (%)
< 230 mm	129	21,2
≥ 230 mm	479	78,8

Crude and Under 5 Mortality Rates

The crude and under five mortality rates were below the emergency threshold¹⁰.

Table 12: Mortality rates, Badghis SMART, February 2016

Definition	Results (95 % CI)
CMR (total deaths/10,000/day)	0.13 (0.06-0.30)
U5MR (deaths in children-5/10,000/day)	0.61 (0.29-1.29)

Health and immunization

Retrospective morbidity data was collected among children 0 -59 months (two weeks recalls) to assess the occurrence of main symptoms of illness. Based on the data, overall 46.7 % of the children had episode of illness in the past 2 weeks prior to the survey (Table 14).

Table 13: Under five morbidity two weeks prior of the survey (n=944), Badghis SMART, February 2016

Parameter	Frequency	Results (%)
Acute Respiratory Infection (ARI)	379	40.1
Fever	401	42.4
Diarrhoea	159	16.8

¹⁰ WHO's emergency thresholds of CMR 2/10,000/day and U5MR 4/10,000/day respectively.

In addition, the survey also assessed the coverage for Vitamin A supplementation, deworming, and immunization among children 0-59 months, results are presented in table 14 and 15 below.

Table 14: Immunization coverage, Badghis SMART, February 2016

Indicators	Criteria	Frequency	Results (%)
Measles among children from 9-59 months (n=816)	Confirmed by card	158	19.3
	Both by recall and by card	567	69.4
BCG among children 0-59 months (n=944)	Scar observed	600	63.6
Polio among children 0-59 months (n=944)	Confirmed by card	263	27.9
	Both by recall and by card	824	87.2

Table 15: Vitamin A supplementation and Deworming, Badghis SMART, February 2016

Indicators	Class	Frequency	Results (%)
Vitamin A supplementation among children 6-59 months (n=867)	Yes	545	62.8
	No	272	31.2
	DK	50	5.7
Deworming among children 12-59 months (n=750)	Yes	249	33.2
	No	428	57.1
	DK	73	9.7

CONCLUSION

The survey findings revealed that the prevalence of Global Acute Malnutrition (GAM) based on weight-for-height z-scores (WHZ) was at 6.5% (4.8-8.8 95% CI) and the prevalence of GAM based on MUAC cut-offs was 8.6 % (6.5-11.3 95% CI) might be classified as “poor” according to WHO classification of acute malnutrition¹¹. SAM prevalence by WHZ and MUAC was at 0.4% and 1.6% respectively. Further analysis of the data suggests that these rates do not refer to the same children. Children classified as wasted based WHZ are not fully overlapping with those classified wasted based on MUAC. If both criteria are combined, overall rate of children likely to be eligible for SAM and MAM management rises to 13.1% (95% CI 10.8-15.3). SAM combined rates is estimated to be 3.2% (2.0 - 4.4 95% CI). It’s recommended to use the combined rates for estimation of GAM and SAM in the province for program design and caseload calculation.

Crude Death Rate and Under-five Death rate was at 0.13/10,000/day and 0.61/10,000/per day. The rates are both below SPHERE emergency thresholds.

In conclusion the survey has indicated that there is a problem of malnutrition in Badghis province. From the results presented above it is notable that although the different measures of malnutrition (WHZ and MUAC) are indicating a poor nutrition situation, but a combination

¹¹ WHO acute malnutrition classification : <5% acceptable, 5-9 % poor, 10-14 % serious, >15 % critical

of these results/measures indicate that the number of cases found malnourished is high in the province. It is also noted that cases of child morbidity are high in the province; almost 1 in 2 children was reported ill. This is possibly contributed by seasonality (survey was conducted in winter) and hence the reason why ARI and fever were higher than diarrhea.

Chronic Malnutrition continues to be a major problem in Badghis and follows the same trend as the other provinces of Afghanistan. Poor micronutrient supplementation and deworming, low maternal nutritional status as witnessed in Badghis can also be contributing factors to the high levels of chronic malnutrition. The fact that chronic malnutrition is not given the attention in the health facilities could be a factor exacerbating the situation. Currently there is no clear guidance in Afghanistan on how to address chronic malnutrition.

SUMMARY RECOMMENDATIONS

Following recommendation can be drawn based on the preliminary findings, per category of action:

High undernutrition rates

- Extension of TSFP and OTP to those districts that still have not OPD-SAM services
- Strengthening of referral system from community up-to hospital (IPD-SAM)
- Strengthening of IYCF and C-IYCF
- HF's staffs to conduct trainings (nutrition and health) at community levels.

Low preventive nutrition and health care coverage (immunization, deworming and supplementation)

- To improve and strengthen fix and outreach EPI activities
- To increase sensitization on BCG, polio and measles as well

High morbidity

- Consider tracking nutritional and immunization status through profiling of cases found.
- Strength health education based on seasonal condition.

Maternal nutrition status

- Strengthening of counseling for community members and HF's staffs
- Provision of IEC material
- Provision of Iron-folate for PLW at HF

More recommendations will be integrated in the final report.

The overall score of this survey is 9%, this is excellent.

There were no duplicate entries detected.

Percentage of children with no exact birthday: 84 %

Anthropometric Indices likely to be in error (-3 to 3 for WHZ, -3 to 3 for HAZ, -3 to 3 for WAZ, from observed mean - chosen in Options panel - these values will be flagged and should be excluded from analysis for a nutrition survey in emergencies. For other surveys this might not be the best procedure e.g. when the percentage of overweight children has to be calculated):

Evaluation of Standard deviation, Normal distribution, Skewness and Kurtosis using the 3 exclusion (Flag) procedures

. no exclusion exclusion from exclusion from
 . reference mean observed mean
 . (WHO flags) (SMART flags)
 .

WHZ

Standard Deviation SD: 1.24 1.20 1.10

(The SD should be between 0.8 and 1.2)

Prevalence (< -2)

observed:	8.1%	8.0%	6.5%
calculated with current SD:	7.4%	6.8%	4.8%
calculated with a SD of 1:	3.7%	3.7%	3.3%

HAZ

Standard Deviation SD: 1.38 1.33 1.21
 (The SD should be between 0.8 and 1.2)
 Prevalence (< -2)
 observed: 51.8% 51.8% 52.5%
 calculated with current SD: 50.2% 50.4% 52.1%
 calculated with a SD of 1: 50.2% 50.5% 52.5%

WAZ
 Standard Deviation SD: 1.10 1.08 1.03
 (The SD should be between 0.8 and 1.2)
 Prevalence (< -2)
 observed: 23.3% 23.3% 23.0%
 calculated with current SD: 25.2% 25.0% 24.1%
 calculated with a SD of 1: 23.1% 23.4% 23.3%

Results for Shapiro-Wilk test for normally (Gaussian) distributed data:

WHZ p= 0.000 p= 0.000 p= 0.008
 HAZ p= 0.000 p= 0.000 p= 0.000
 WAZ p= 0.000 p= 0.000 p= 0.000

(If p < 0.05 then the data are not normally distributed. If p > 0.05 you can consider the data normally distributed)

Skewness

WHZ -0.15 -0.40 -0.18
 HAZ 0.85 0.36 0.09
 WAZ -0.05 -0.28 -0.30

If the value is:

- below minus 0.4 there is a relative excess of wasted/stunted/underweight subjects in the sample
- between minus 0.4 and minus 0.2, there may be a relative excess of wasted/stunted/underweight subjects in the sample.
- between minus 0.2 and plus 0.2, the distribution can be considered as symmetrical.
- between 0.2 and 0.4, there may be an excess of obese/tall/overweight subjects in the sample.
- above 0.4, there is an excess of obese/tall/overweight subjects in the sample

Kurtosis

WHZ 2.46 0.58 -0.16
 HAZ 4.62 0.46 -0.66
 WAZ 1.59 0.44 0.05

Kurtosis characterizes the relative size of the body versus the tails of the distribution. Positive kurtosis indicates relatively large tails and small body. Negative kurtosis indicates relatively large body and small tails.

If the absolute value is:

- above 0.4 it indicates a problem. There might have been a problem with data collection or sampling.
- between 0.2 and 0.4, the data may be affected with a problem.
- less than an absolute value of 0.2 the distribution can be considered as normal.

Test if cases are randomly distributed or aggregated over the clusters by calculation of the Index of Dispersion (ID) and comparison with the Poisson distribution for:

WHZ < -2: ID=1.36 (p=0.050)
 WHZ < -3: ID=0.96 (p=0.556)
 GAM: ID=1.36 (p=0.050)
 SAM: ID=0.96 (p=0.556)
 HAZ < -2: ID=2.36 (p=0.000)
 HAZ < -3: ID=2.01 (p=0.000)
 WAZ < -2: ID=1.61 (p=0.005)
 WAZ < -3: ID=1.13 (p=0.257)

Subjects with SMART flags are excluded from this analysis.

The Index of Dispersion (ID) indicates the degree to which the cases are aggregated into certain clusters (the degree to which there are "pockets"). If the ID is less than 1 and p > 0.95 it indicates that the cases are UNIFORMLY distributed among the clusters. If the p value is between 0.05 and 0.95 the cases appear to be randomly distributed among the clusters, if ID is higher than 1 and p is less than 0.05 the cases are aggregated into certain cluster (there appear to be pockets of cases). If this is the case for Oedema but not for WHZ then aggregation of GAM and SAM cases is likely due to inclusion of oedematous cases in GAM and SAM estimates.

Are the data of the same quality at the beginning and the end of the clusters?

Evaluation of the SD for WHZ depending upon the order the cases are measured within each cluster (if one cluster per day is measured then this will be related to the time of the day the measurement is made).

Time point	SD for WHZ															
	0.8	0.9	1.0	1.1	1.2	1.3	1.4	1.5	1.6	1.7	1.8	1.9	2.0	2.1	2.2	2.3

54 to 59	6	5/7.3 (0.7)	6/7.2 (0.8)	11/14.4 (0.8)	0.83

6 to 59 54 68/67.5 (1.0) 67/67.5 (1.0) 1.01

The data are expressed as observed number/expected number (ratio of obs/expect)

Overall sex ratio: p-value = 0.931 (boys and girls equally represented)

Overall age distribution: p-value = 0.004 (significant difference)

Overall age distribution for boys: p-value = 0.022 (significant difference)
 Overall age distribution for girls: p-value = 0.152 (as expected)
 Overall sex/age distribution: p-value = 0.001 (significant difference)

Team 4:

Age cat.	mo.	boys	girls	total	ratio boys/girls
6 to 17	12	13/14.4 (0.9)	11/13.9 (0.8)	24/28.3 (0.8)	1.18
18 to 29	12	22/14.0 (1.6)	14/13.6 (1.0)	36/27.6 (1.3)	1.57
30 to 41	12	9/13.6 (0.7)	18/13.2 (1.4)	27/26.7 (1.0)	0.50
42 to 53	12	12/13.4 (0.9)	15/12.9 (1.2)	27/26.3 (1.0)	0.80
54 to 59	6	6/6.6 (0.9)	2/6.4 (0.3)	8/13.0 (0.6)	3.00

6 to 59 54 62/61.0 (1.0) 60/61.0 (1.0) 1.03
 The data are expressed as observed number/expected number (ratio of obs/expect)
 Overall sex ratio: p-value = 0.856 (boys and girls equally represented)
 Overall age distribution: p-value = 0.270 (as expected)
 Overall age distribution for boys: p-value = 0.170 (as expected)
 Overall age distribution for girls: p-value = 0.217 (as expected)
 Overall sex/age distribution: p-value = 0.016 (significant difference)

Team 5:

Age cat.	mo.	boys	girls	total	ratio boys/girls
6 to 17	12	20/15.3 (1.3)	13/16.2 (0.8)	33/31.6 (1.0)	1.54

6 to 59 54 70/64.0 (1.1) 58/64.0 (0.9) 1.21
 The data are expressed as observed number/expected number (ratio of obs/expect)
 Overall sex ratio: p-value = 0.289 (boys and girls equally represented)
 Overall age distribution: p-value = 0.053 (as expected)
 Overall age distribution for boys: p-value = 0.270 (as expected)
 Overall age distribution for girls: p-value = 0.100 (as expected)
 Overall sex/age distribution: p-value = 0.008 (significant difference)

Evaluation of the SD for WHZ depending upon the order the cases are measured within each cluster (if one cluster per day is measured then this will be related to the time of the day the measurement is made).

Team: 1

Time point	SD for WHZ															
	0.8	0.9	1.0	1.1	1.2	1.3	1.4	1.5	1.6	1.7	1.8	1.9	2.0	2.1	2.2	2.3
